Given a [URL of a dynamic CSV file](#) containing a list of different banks, tenure in months, interest rates, and minimum loan amount:

1. Write a function that will return the data in a prescribed JSON structure (see below)
2. Write a web app, in your choice of language/framework, which would serve that info at the url `emi-rates` filtered for amount provided as a GET param (e.g. `/emi-rates?amount=10000`)

JSON example with one bank and one tenure

```
[
  {
    "bank": "HDFC",
    "tenures": [
      {
        "months": 3,
        "rate": 13,
        "minimum_amount": 3000
      }
    ]
  }
]
```
